About the Authors

Samuel Vionnet is an independent consultant at Valuing Nature. He focuses on helping organizations integrating the value of nature in decision-making, by providing expertise in economic water valuation, using the concepts of ecosystem services and natural capital accounting. As of 2016 Samuel has over eight years of experience in sustainability and water stewardship, having worked several years on water footprint studies, methods, and databases at Quantis, a life cycle assessment (LCA) consulting company. His work covers sustainability metrics, water stewardship, supply chain management and risk assessment, sustainability strategy, and natural capital accounting. Samuel graduated with a M.Sc. in Material Science from the Swiss Federal Institute of Technology in Lausanne (EPFL, Switzerland).

Lindsay Lessard works as a life cycle analyst at Quantis, a life cycle assessment (LCA) consulting company. She has completed several life cycle assessment and water footprint projects in the food and beverage, cosmetics, textiles, packaging, nanoparticles, information and communication technology, and renewable energy sectors. Lindsay obtained a Bachelor and Master of Chemical Engineering degree from McGill University (Montréal) in 2006 and a Diplôme d'études supérieures spécialisées (Graduate Studies Diploma) in Energy and Sustainable Development from École Polytechnique de Montréal (2009). She also worked for two years as a process engineer. She joined the Quantis team in 2010.

Anna Kounina works as a life cycle consultant at Quantis, a life cycle assessment (LCA) consulting company. Anna serves in various roles at Quantis: life cycle analyst, project manager, researcher and trainer on water footprint and toxic impact modelling, and expert in topics such as impact modelling with USEtox, water footprint according to ISO 14046, and life cycle inventory (LCI) database development. Anna holds a PhD. degree on water use and quality in life cycle assessment (LCA) and a M.Sc. in environmental engineering from the Swiss Federal Institute of Technology in Lausanne (EPFL, Switzerland). She joined the Quantis team in 2010.

Sebastien Humbert is co-founder and scientific director of Quantis, a life cycle assessment (LCA) consulting company. He was convener of the working group which drafted the International Standards ISO 14046 on water footprint and

ISO/TR 14073 on water footprint examples. He is co-developer of the impact assessment methods IMPACT 2002+ and IMPACT World+ and the inventory databases “The Quantis Water database” and “The World Food LCA database”. He is involved into several Product and Organisational Environmental Footprint (PEF/OEF) pilots. As of 2017 he has 16 years of experience in LCA and water footprinting. Sebastien holds a PhD. degree in life cycle assessment (LCA) from the University of California, Berkeley and a M.Sc. in environmental engineering from the Swiss Federal Institute of Technology in Lausanne (EPFL, Switzerland).

About the Reviewers

Dr Tim Hess is Associate Professor in Water Management at Cranfield University, UK. He is an Agro-hydrologist with 35 years’ experience of research, consultancy and teaching at the interface of agriculture, food and water. He has over 50 publications in peer-reviewed journals on hydrology and water management in agriculture and natural environments. He was Committee Member for ISO 14046 “Water Footprinting” and an editor of the accompanying Technical Report. He chaired the International Life Sciences Institute (ILSI) Expert Group on Water Footprinting and was lead author for the UK Global Food Security programme’s report on “Water Use in our Food Imports”.

Alessandro Manzardo, Senior Associate Researcher for the Department of Industrial Engineering of the University of Padova (Italy) on the topic of Scarce Resource Management. He got a PhD on the development of Water Footprint models to support company competitiveness. He represented Italy in the process of the development of ISO 14046 on Water Footprint and he is actually involved in several UN programme related to water: such as the WULCA of the UNEP-LCI (a group focused on the development of water scarcity methods in LCA) and LEAP of FAO (a group for the development of guidelines for the application of LCA in the livestock sector).

Dr. Peter Saling joined BASF in 1993, working as toxicology specialist in the department for dyestuffs. In 1997, he moved to the division of environment, health and safety. He was project leader for the development and integration of social aspects into the sustainability analysis (SEEBALANCE). From 2007 to 2013 he was the Director of Eco-Efficiency Analysis and of Sustainability

Evaluation in BASF. In 2011 he finalized the development of the new AgBalance methodology. Since 2014 he is responsible as Director for the Sustainability methods of BASF worldwide with centres in USA, Brazil and Asia. In 2014 he received a lectureship at the Environmental Management and Accounting department of the Technical University of Dresden.

Acknowledgements

ISO and ITC published this handbook to support the implementation by SMEs of ISO 14046, *Environmental management – Water footprint – Principles, requirements and guidelines*, which was developed by ISO/TC 207.

ISO and ITC wish to thank the authors Samuel Vionnet, Lindsay Lessard, Anna Kounina and Sebastien Humbert, in addition to Dr Tim Hess, Alessandro Manzardo and Dr Peter Saling for providing feedback on the handbook.

Views expressed in this publication are those of the authors and do not necessarily reflect those of ISO and ITC.

Foreword	8
1 Scope	11
1.1 Why is water important?	12
1.2 Why ISO 14046?	15
1.3 What is a water footprint... in short?	17
1.4 What are the steps towards completing a water footprint?	21
1.5 What is the profile of a water footprint practitioner?	23
2 Identifying the goal and defining the scope of the study	25
2.1 Setting the goal of the study	26
2.2 Setting the scope of the study	28
2.3 Setting the system boundary and the functional unit	29
2.4 Reaching the goal with additional resources	33
2.5 Checklist	37
3 Water footprint inventory analysis	39
3.1 Defining the inventory structure	40
3.2 Dealing with multi-output processes (allocation)	48
3.3 Deciding when to collect data from primary and secondary sources	51
3.4 Identifying the most appropriate secondary data sources	52
3.5 Choosing a software to perform the water footprint assessment	59
3.6 Checklist	63
4 Water footprint impact assessment	65
4.1 General concept of impact assessment	66
4.2 Choosing the type of water footprint	69
4.3 Choosing the impact assessment method	70
4.4 Checklist	85
5 Interpretation	87
5.1 What should be interpreted?	88
5.2 Identifying limitations	88
5.3 Performing a critical review	89

5.4	Reporting the water footprint assessment.....	90
5.5	Certifying the water footprint assessment	90
5.6	Offsetting the water footprint results	90
5.7	Checklist	91
	Bibliography.....	93

Foreword

Water is key to life, for both humans and ecosystems. However, due to growing pressure in several parts of the world, mainly from human activity, more water is being used than is being replenished.

Water availability, both in terms of quantity and quality, is recognized as a key global issue by the United Nations. Several of the United Nations' Sustainable Development Goals (SDGs) are in fact linked to water. For example, Goals n° 6 and n° 14 are about clean water and sanitation, and life below water, respectively.

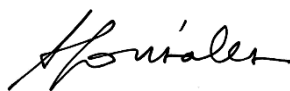

To address the issues of both water shortages and the pollution of water bodies, it is critical that we have correct and relevant data.

Businesses (both directly and indirectly through their supply chain), communities and customers have started to request quantitative information about how their production processes place pressure on water resources, in order to understand and tackle issues under their responsibility. Such quantitative information is known under the concept of water footprinting. A water footprint is a metric(s) that quantifies the potential environmental impacts related to water, accounting for both water consumption and water pollution as well as considering the influence of location, timing and other relevant information.

This document targets practitioners from various backgrounds, such as large companies, public authorities, non-governmental organizations, academic and research groups as well as small and medium enterprises (SMEs). Its intention is not to detail and interpret each chapter of ISO 14046, but to provide practical guidance for carrying out a water footprint assessment.

With a view to helping SMEs improve their preparedness and effectively assess their water footprint, ISO and the International Trade Centre have decided to join efforts and develop this guide on ISO 14046:2014. This publication aims to help SMEs better understand the requirements of ISO 14046:2014, develop a sustainable approach to water use through the assessment of their water footprint, and to align their practices according to the International Standard.

This handbook will serve as a practical tool and a useful resource for practitioners in their efforts to understand better their dependence on water, and look at alternatives with less impact. It is an important roadmap to help SMEs and policymakers measure better, meet aspects of the SDGs and contribute to a more effective sustainable management of our shared resources.
